Seong Yoon Kim

Prevalence of dementia in Korea is 9.1% of the elderly population, and those with dementia are thus estimated to be nearly 750,000. Dementia due to Alzheimer's disease (AD) accounts for 45–75% of all dementia syndromes, whereas vascular dementia accounts for about 12–37%. Clinical research on AD has been greatly expanded in volume and quality in the last 10 years in Korea, partly due to public and governmental awareness of the increase of the elderly population. The national drug market for dementia in 2020 is estimated to be US\$ 1,700 million. Past experiences in clinical research or drug trials for AD have taught us several lessons: 1) cognitive tests and function measurements need careful interpretation due to the unstable educational system in Korea between 1940 and 1970, and the rapid industrialization of modern Korean society; 2) in a governmental drive to encourage clinical research, several national collaborative research networks will work as a solid base for future clinical trials; 3) recent revision of clinical research-related regulations, and a change in the general public's views on drug trials, can be both an advantage and a disadvantage for drug trials at the same time.
